In the Claims:

1. (Currently Amended) A method of ~~analyzing a capital investment in~~ transforming a wireless network, the method comprising:

using a computer system for determining a subscriber profit proxy for a plurality of ~~subscribers;~~ subscribers in the wireless network;

using the computer system for determining a number of minutes of use over a period of time for one or more of the subscribers;

using the computer system for determining a service quality metric for one or more sectors in the wireless network;

using the computer system for determining an investment return per sector for one or more of the ~~sectors; and~~ sectors, wherein the investment return is based upon the subscriber profit proxy for the plurality of subscribers, the number of minutes of use over the period of time for the one or more of the subscribers, and the service quality metric for the one or more sectors in the wireless network; and

using the computer system for selecting ~~analyzing~~ an area for ~~the~~ capital investment, the ~~analyzing being~~ selecting based at least in part on the investment return per sector.

2. (Original) The method of claim 1, wherein the subscriber profit proxy is based at least in part on revenue collected from the subscriber, an expected number of months under a contract, an acquisition cost, and a service delivery cost.

3. (Currently Amended) The method of claim 2, wherein the subscriber profit proxy (SPP) value is determined at least in part by the equation:

$$SPP_i = V_i * M_i - A_i - S_i$$

wherein

V_i is the revenue per month for subscriber I;

M_i is the expected months under contract for subscriber I;

A_i is the acquisition cost for subscriber I; and

S_i is the service delivery cost for subscriber [[i.]] I.

4. (Currently Amended) The method of claim 1, wherein the minutes of use over the period of time is based on call detail records collected during peak usage periods.

5. (Original) The method of claim 1, wherein the service quality metric comprises a dropped call rate for each sector.

6. (Original) The method of claim 5, wherein the dropped call rate is determined from call detail records collected from each sector.

7. (Currently Amended) The method of claim 1, wherein the determining the investment return comprises:

determining a profit per sector;

determining a dropped-call rate per sector;

determining an investment needed per sector to ~~recover~~ reduce dropped calls in each sector; and

determining the investment return per sector based at least in part on the profit per sector,

the dropped-call rate ~~for each~~ per sector, and the investment needed per sector to ~~recover~~ reduce dropped ~~call~~ calls in each sector.

8. (Previously Presented) The method of claim 7, wherein the determining the profit per sector is performed in accordance with the equation:

$$P_k = \sum_i \left[SPP_i * \frac{MOU_{ik}}{\sum_j MOU_{ij}} \right]$$

wherein

k represents a sector;

I represents a subscriber;

P_k is the profit for sector k;

SPP_I is the subscriber profit proxy value for subscriber I;

MOU_{ik} is the minutes of use for subscriber I in sector k; and

$\sum_j MOU_{ij}$ is a sum of the minutes of use for subscriber I in all sectors.

9. (Currently Amended) The method of claim 7, wherein the determining the investment return of a sector is performed in accordance with the equation:

$$R_k = P_k + D_k - I_k$$

wherein

k represents a sector;

P_k is the profit for sector k;

D_k is the drop-call rate for sector k; and

I_k is investment needed to investment needed to ~~recover~~ reduce dropped ~~call~~ calls in sector k.

10. (Currently Amended) The method of claim 1, wherein the ~~analyzing~~ selecting the area for the capital investment is performed at least in part by prioritizing the sectors based upon the investment return for each respective sector.

11-15. (Canceled)

16. (Withdrawn) A method of determining an investment strategy for a coverage hole in a wireless network, the coverage hole being an area in which service is not available, the method comprising:

identifying one or more coverage holes in the wireless network;

determining revenue loss for one or more of the coverage holes;

determining one or more BTS options for locating a BTS;

determining a cost for one or more of the BTS options;

determining an investment return value for one or more of the BTS options; and

determining one or more locations to deploy a BTS based at least in part on the investment return value for the BTS options.

17. (Withdrawn) The method of claim 16, wherein the identifying one or more coverage holes is based at least in part on dropped calls as indicated by call detail records (CDRs).

18. (Withdrawn) The method of claim 16, wherein the determining the revenue loss is performed in accordance with the equation:

$$U_k = \Sigma_i \left[D_{ik} * AMOU_i * UPM_i \right]$$

wherein

k represents a coverage hole;

I represents a subscriber;

D_{ik} is a number of monthly dropped calls by subscriber I at coverage hole k;

$AMOU_i$ is the average MOU per call of subscriber I;

UPM_i is the revenue generated per minute by subscriber I; and

U_k is the revenue loss at coverage hole k.

19. (Withdrawn) The method of claim 16, wherein the determining the cost for one or more of the BTS options is performed at least in part by summing a monthly equipment cost, a site monthly leasing cost, and a monthly transport leasing cost.

20. (Withdrawn) The method of claim 16, wherein the determining the investment return value is performed at least in part by subtracting the cost from the revenue loss.

21. (Withdrawn) The method of claim 16, wherein the determining one or more locations to deploy a BTS is performed at least in part by prioritizing the BTSs in order of the investment return value.

22. (Currently Amended) A computer program product for analyzing a capital investment in a wireless network, the computer program product having a medium with a computer program embodied thereon, the computer program product comprising:

computer program code for determining a subscriber profit proxy for a plurality of ~~subscribers;~~ subscribers in the wireless network;

computer program code for determining a number of minutes of use over a period of time for one or more of the subscribers;

computer program code for determining a service quality metric for one or more sectors in the wireless network;

computer program code for determining an investment return for one or more of the ~~sectors; and~~ sectors, wherein the investment return is based upon the subscriber profit proxy for the plurality of subscribers, the number of minutes of use over the period of time for the one or more of the subscribers, and the service quality metric for the one or more sectors in the wireless network; and

computer program code for ~~analyzing~~ selecting an area for the capital investment, the ~~analyzing being~~ selecting based at least in part on the investment return for the one or more sectors.

23. (Original) The computer program product of claim 22, wherein the computer program code for determining a subscriber profit proxy includes computer program code for including revenue collected from the subscriber, an expected number of months under a contract, an acquisition cost, and a service delivery cost.

24. (Currently Amended) The computer program product of claim 22, wherein the computer program code for determining a subscriber profit proxy (SPP) value includes computer program code for performing the equation:

$$SPP_i = V_i * M_i - A_i - S_i$$

wherein

V_i is the revenue per month for subscriber I;

M_i is the expected months under contract for subscriber I;

A_i is the acquisition cost for subscriber I; and

S_i is the service delivery cost for subscriber [[i.]] I.

25. (Currently Amended) The computer program product of claim 22, wherein the minutes of use over the period of time is based on call detail records collected during peak usage periods.

26. (Original) The computer program product of claim 22, wherein the computer program code for determining a service quality metric includes computer program code for determining a dropped call rate for each of the one or more sectors.

27. (Original) The computer program product of claim 26, wherein the dropped call rate is determined from call detail records collected from each of the one or more sectors.

28. (Currently Amended) The computer program product of claim 22, wherein the computer program code for determining the investment return comprises:

computer program code for determining a profit per sector;

computer program code for determining a dropped-call rate per sector;

computer program code for determining an investment needed per sector to ~~recover~~ reduce dropped calls in each sector; and

computer program code for determining the investment return per sector based at least in part on the profit per sector, the dropped-call rate ~~for each~~ per sector, and the investment needed per sector to ~~recover~~ reduce dropped ~~call~~ calls in each sector.

29. (Previously Presented) The computer program product of claim 28, wherein the computer program code for determining the profit per sector includes computer program code to perform the equation:

$$P_k = \sum_i \left[SPP_i * \frac{MOU_{ik}}{\sum_j MOU_{ij}} \right]$$

wherein

k represents a sector;

i represents a subscriber;

P_k is the profit for sector k;

SPP_i is the subscriber profit proxy value for subscriber i;

MOU_{ik} is the minutes of use for subscriber i in sector k; and

$\sum_j MOU_{ij}$ is a sum of the minutes of use for subscriber i in all sectors.

30. (Currently Amended) The computer program product of claim 29, wherein the computer program code for determining the investment return of a sector includes computer program code for performing the equation:

$$R_k = P_k + D_k - I_k$$

wherein

k represents a sector;

P_k is the profit for sector k;

D_k is the drop-call rate for sector k; and

I_k is investment needed to investment needed to ~~recover~~ reduce dropped ~~call~~ calls in sector k.

31. (Currently Amended) The computer program product of claim 22, wherein the computer program code for ~~analyzing~~ selecting an area for the capital investment includes computer program code for prioritizing the sectors based upon the investment return for each respective sector.

32-36. (Canceled)

37. (Withdrawn) A computer program product for determining an investment strategy for a coverage hole in a wireless network, the coverage hole being an area in which service is not available, the computer program product having a medium with a computer program embodied thereon, the computer program product comprising:

computer program code for identifying one or more coverage holes in the wireless

network;

computer program code for determining revenue loss for one or more of the coverage holes;

computer program code for determining one or more BTS options for locating a BTS;

computer program code for determining a cost for one or more of the BTS options;

computer program code for determining an investment return value for each of the one or more new BTS options; and

computer program code for determining one or more locations to deploy a BTS based at least in part on the investment return value for the BTS options.

38. (Withdrawn) The computer program product of claim 37, wherein the computer program code for determining one or more coverage holes is based at least in part on dropped calls as indicated by call detail records (CDRs).

39. (Withdrawn) The computer program product of claim 37, wherein the computer program code for determining revenue loss includes computer program code for performing the equation:

$$U_i = \Sigma_i \left[D_{ik} * AMOU_i * UPM_i \right]$$

wherein

k represents a coverage hole;

I represents a subscriber;

D_{ik} is a number of monthly dropped calls by subscriber I at coverage hole k;

$AMOU_i$ is the average MOU per call of subscriber I;

UPM_i is the revenue generated per minute by subscriber I; and

U_k is the revenue loss at coverage hole k.

40. (Withdrawn) The computer program product of claim 37, wherein the computer program code for determining the cost for one or more of the BTS options includes computer program code for summing a monthly equipment cost, a site monthly leasing cost, and a monthly transport leasing cost.

41. (Withdrawn) The computer program product of claim 37, wherein the computer program code for determining an investment return value includes computer program code for subtracting the cost from the revenue loss.

42. (Withdrawn) The computer program product of claim 37, wherein the computer program code for determining one or more locations to deploy a BTS includes computer program code for prioritizing the BTSs in order of the investment return value.

43. (Currently Amended) ~~The method of claim 1, further comprising~~ A method of transforming a wireless network, the method comprising:

determining a subscriber profit proxy for a plurality of subscribers in the wireless network;

determining a number of minutes of use over a period of time for one or more of the subscribers;

determining a service quality metric for one or more sectors in the wireless network;

determining an investment return per sector for one or more of the sectors, wherein the

investment return is based upon the subscriber profit proxy for the plurality of subscribers, the number of minutes of use over the period of time for the one or more of the subscribers, and the service quality metric for the one or more sectors in the wireless network;

analyzing an area for capital investment, the analyzing based at least in part on the investment return per sector; and

modifying the wireless network by deploying ~~the capital investment~~ additional equipment to a base transceiver station (BTS) serving at least one ~~sector~~ sector, the modifying based at least in part on the analyzing the area for the capital investment. ~~investment, wherein the capital investment comprises additional equipment.~~

44. (Previously Presented) The method of claim 43, wherein the additional equipment is selected from the group consisting of: a radio tower, an antenna, a radio, a cable, and combinations thereof.

45. (New) The method of claim 43, wherein the subscriber profit proxy is based at least in part on revenue collected from the subscriber, an expected number of months under a contract, an acquisition cost, and a service delivery cost.

46. (New) The method of claim 45, wherein the subscriber profit proxy (SPP) value is determined at least in part by the equation:

$$SPP_i = V_i * M_i - A_i - S_i$$

wherein

V_i is the revenue per month for subscriber I;

M_i is the expected months under contract for subscriber I;

A_i is the acquisition cost for subscriber I; and

S_i is the service delivery cost for subscriber I.

47. (New) The method of claim 43, wherein the minutes of use over the period of time is based on call detail records collected during peak usage periods.

48. (New) The method of claim 43, wherein the service quality metric comprises a dropped call rate for each sector.

49. (New) The method of claim 43, wherein the determining the investment return comprises:

determining a profit per sector;

determining a dropped-call rate per sector;

determining an investment needed per sector to reduce dropped calls in each sector; and

determining the investment return per sector based at least in part on the profit per sector, the dropped-call rate per sector, and the investment needed per sector to reduce dropped calls in each sector.

50. (New) The method of claim 49, wherein the determining the profit per sector is performed in accordance with the equation:

$$P_k = \sum_i \left[SPP_i * \frac{MOU_{ik}}{\sum_j MOU_{ij}} \right]$$

wherein

k represents a sector;

I represents a subscriber;

P_k is the profit for sector k;

SPP_i is the subscriber profit proxy value for subscriber I;

MOU_{ik} is the minutes of use for subscriber I in sector k; and

$\sum_j MOU_{ij}$ is a sum of the minutes of use for subscriber I in all sectors.

51. (New) The method of claim 49, wherein the determining the investment return of a sector is performed in accordance with the equation:

$$R_k = P_k + D_k - I_k$$

wherein

k represents a sector;

P_k is the profit for sector k;

D_k is the drop-call rate for sector k; and

I_k is investment needed to investment needed to reduce dropped calls in sector k.

52. (New) The method of claim 43, wherein the analyzing the area for the capital investment is performed at least in part by prioritizing the sectors based upon the investment return for each respective sector.
